VehicleGPT Edge

Evidence-grounded vehicle intelligence — offline, historical, resource-aware

1 Evidence before language

SQL/analytics compute facts; the SLM explains the retrieved evidence.

2 Edge-first by design

No cloud at query time; short context, quantized model, fast path.

3 Safety boundary

Read-only information layer; no actuator-write path or control authority.

OFFICIAL CONSTRAINTS | No cloud dependency • ~2 GB RAM / ~2 ARM cores • <2 s common-query target • several weeks searchable

Proposal only: memory, latency, model quality and protocol integration must be measured; no benchmark results are claimed.
